Tempo

Acoustic wall & ceiling slats

Tempo was inspired by the spare and linear architecture of mid-century greats including Richard Neutra and Ludwig Mies Van Der Rohe.

Tempo works particularly well when used to create strong horizontal and vertical lines in conjunction with planes of glass, concrete and other brutalist materials.

The construction of Tempo Class A sound absorbent panels is tailored to mitigate sound reflection and to dramatically reduce unacceptable reverberation times.

Installation of Tempo panels is fast and simple thanks to the innovative wall and ceiling fix method. The fixing track can be specified in any RAL colour to match or contrast with the selected fabric facing panels.

Technical Information

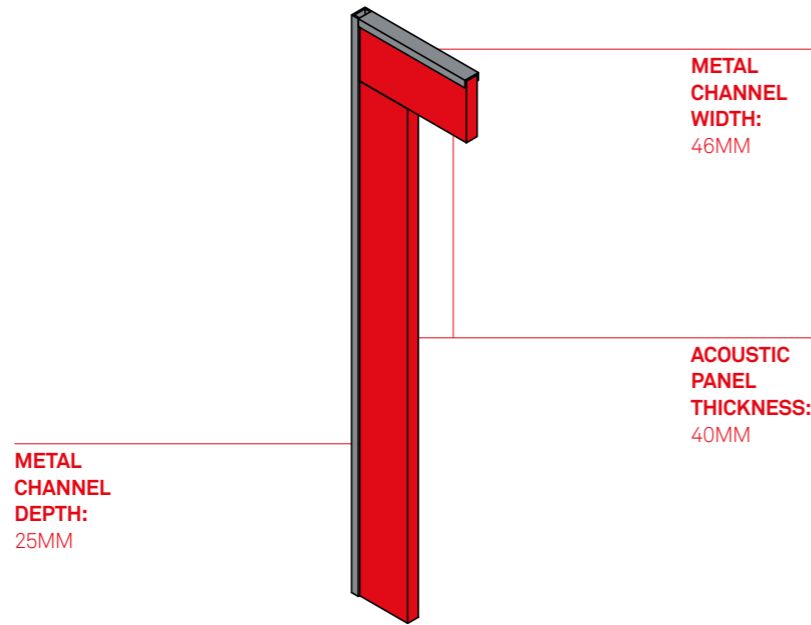

Dimensions

Our angular acoustic panel system consists of two Class A acoustic panels set into a metal channel which is fixed to both a wall and ceiling. The combination of vertical and horizontal panels is highly effective in controlling reverberation.

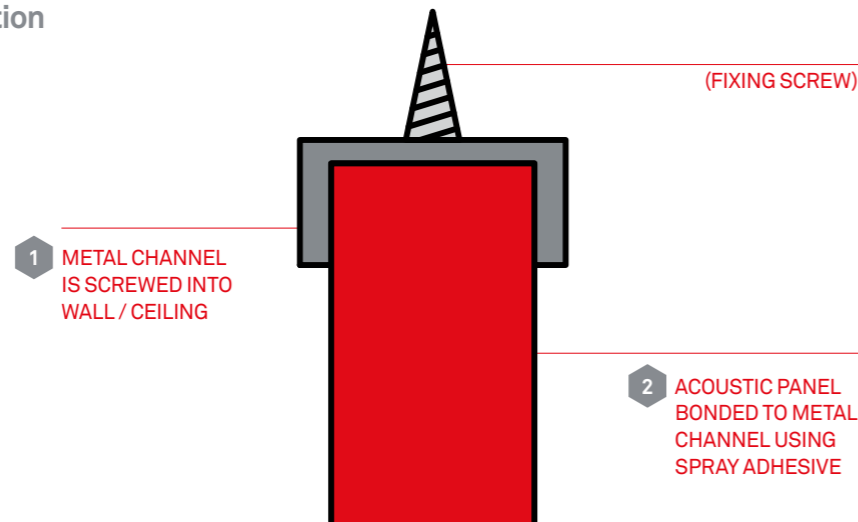

The metal channel component can be provided at a size of up to 5000mm with no join.

The acoustic panel component can be provided at a size of up to 2700mm with no join.

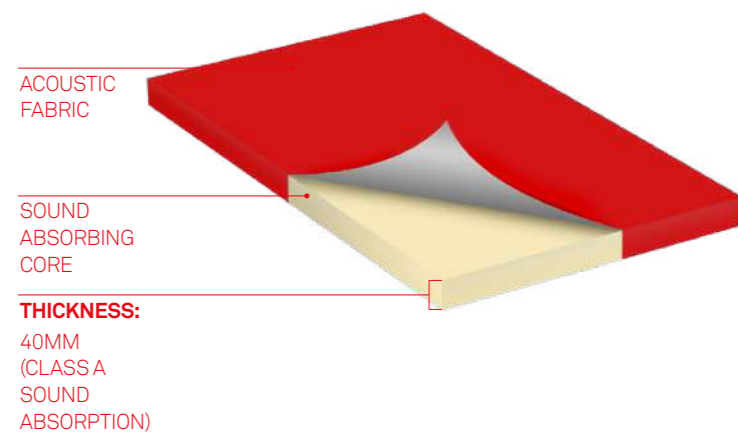

The depth of the acoustic panel component can be provided at a maximum of 500mm and a minimum of 100mm.
